## Monitoring Data

Volume II of the *Site Environmental Report for 2006* is provided by Ernest Orlando Lawrence Berkeley National Laboratory as a supplemental appendix to Volume I, which contains the body of the report. Volume II contains the environmental monitoring and sampling data used to generate summary results of routine and nonroutine activities at the Laboratory (except for groundwater sampling data, which may be found in the reports referred to in Chapter 4). Volume I summarizes the results from analyses of the data.

The results from sample collections are more comprehensive in Volume II than in Volume I: For completeness, all results from sample collections that began or ended in calendar year (CY) 2006 are included in this volume. However, the samples representing CY 2005 data have not been used in the summary results that are reported in Volume I. (For example, although ambient air samples collected on January 2, 2006, are presented in Volume II, they represent December 2005 data and are not included in Table 4-2 in Volume I.)

When appropriate, sampling results are reported in both conventional and International System of Units (SI). For some results, the rounding procedure used in data reporting may result in apparent differences between the numbers reported in SI and conventional units. (For example, stack air results reported as < 1.1 Bq/m<sup>3</sup> are shown variously as < 28, < 30 and < 31 pCi/m<sup>3</sup>. Each of these results is rounded correctly to two significant digits.)

The list below categorizes the Volume II data sections with corresponding summary result tables in Volume I:

Volume II section	Volume I summary table
Stack Air	No summary table; results discussed in Section 4.2.1
Ambient Air	4-2, Summary of Gross Alpha and Gross Beta Ambient-Air Particulate Sampling Network Results

### ***Results Below the Detection Limit***

Nonradiological results that cannot be quantified (because they are below the detection limit of the analysis) are reported as less than the reporting limit (for example, “ $< 10 \mu\text{g/L}$ ”). Radiological results that cannot be quantified are generally reported as less than the minimum detectable activity (MDA) (for example, “ $< 0.15 \text{ Bq/L}$ ”). When the MDA is not available, the reporting limit is used. Reporting limits are typically constant between sample results for a particular analyte, but MDAs can vary between sample results for any one analyte.
